Micronutrient levels in Georgia's soils are usually adequate for wheat production unless soils have been over-limed. The two micronutrients most likely to be deficient, and the ones routinely tested for with soil testing, are zinc (Zn) and manganese (Mn). Adequate baseline levels of soil test Zn and Mn should be maintained.

Proper pH, fertilizer amounts, and timing can have a huge impact on wheat yield and quality. To properly manage fertility in wheat we need to have recent soil samples, anticipated yield goal, and crop history for the field. Typical yields in our area of 40 – 70 bushels of wheat per acre will require between 80 and 100 pounds of nitrogen (N) per acre.

~~Fertilizing Wheat—University of Georgia~~

According to the 2017-18 Extension Wheat Production Guide, Georgia farmers planted 160,000 acres in the 2016-2017 season, which marked the third year the state's wheat acreage declined. Growers only harvested 70,000 acres, or 43 percent of the planted area, due to disease pressure and poor environmental conditions.

~~Media Newswire—Story—Wheat Crop—University of Georgia~~

A full-season soybean budget is included for comparison with wheat double-cropped bean production. At the wheat and soybean prices that the market has been offering in 2012 and 2013 this double-cropped system is highly profitable. The wheat budgets presented here are based on practices outlined throughout this production guide.
